

Auriga Competitive Intelligence Report

Vision

Auriga is an offline-first embodied spatial intelligence platform for blind and visually impaired users. It combines perception, navigation, guidance, memory, and learning.

Commercial Landscape

Key competitors include Google Lookout, Seeing AI, Envision AI, Be My Eyes/Be My AI, NaviLens, Lazarillo, Aira, and Supersense. Most excel at object recognition or OCR but lack persistent spatial memory and world modelling.

Open Source Stack

Recommended foundations: Ultralytics YOLO, MediaPipe, LiteRT, CameraX samples, RTAB-Map, ORB-SLAM3 (conceptual), Room, Hilt, Timber, Coil.

Build vs Borrow

Borrow generic capabilities such as camera, inference runtime, object detection, persistence, and logging. Build original IP around Guidance Engine, Hazard Engine, Place Memory, World Model, Continuous Learning, Virtual Fiducials, and the Auriga Orchestrator.

24-Repository Ecosystem

The repositories represent specialist teams whose outputs converge into a single Android application. They are not separate products.

MVP

Focus on Camera → Detection → Distance/Bearing → Hazard → Guidance → Audio/Haptics. Add Place Memory, World Model, and Continuous Learning incrementally.

Commercial Strategy

Launch in Kenya, validate with users, expand across Africa, then selected Asian markets. Maintain offline-first privacy and optional encrypted backups only if introduced later.

Next Steps

Stabilize Android build, integrate proven open-source components, complete the perception loop, then field test with real users before expanding functionality.
